ANNUAL SUMMARY FOR 2000

At first glance, the 2000 Oklahoma climate may have seemed a bit bland: a little warmer and wetter than normal. In actuality, 2000 was an exhibition of the extremes Oklahoma's climate has to offer. From searing heat to bone-chilling cold, parched earth to catastrophic flash floods and winter storms; the year's weather was far from uneventful.

The statewide-averaged annual temperature of 60.5 degrees ranks 2000 as the 49th warmest year since record keeping began in 1892. This ranking occurred despite inclusion of a November-December period that fell 7.6 degrees lower than normal, the coldest such period on record. Individually, November and December were the 3rd and 2nd coldest on record, respectively, with December being the coldest month experienced by Oklahoma since the now-famous mini-ice age in December of 1983. The year-end frigid temperatures were countered by the 9th warmest winter (1999 - 2000) on record, along with the drought-ravaged month of August, when temperatures soared and the soil cracked. A statewide-averaged temperature of 85.7 degrees placed it as the 5th warmest August on record. The spring and summer season temperatures were also above normal, albeit slightly. Buoyed by the cold November, the autumn season finished as the 44th coldest since 1892.

Statewide-Averaged Temperature (F) by Season (Rank: 1=coldest, 109=warmest)

<u>Season</u>	<u>Temp.</u>	<u>Dep.</u>	<u>Rank</u>
Winter (Dec 99 – Feb 00)	43.5	+4.5	100
Spring (Mar – May 00)	60.7	+0.7	78
Summer (Jun – Aug 00)	80.5	+0.5	63
Autumn (Sep – Nov 00)	61.2	-0.4	44

Several oddities occurred in the state's temperatures throughout the year. Most notably were the temperature extremes in May and October. Daytime highs in May exceeded 100 degrees on ten different dates. Altus and Frederick both reached 112 degrees, setting the all-time record high for May. Not to be outdone in peculiarity, the first week of October was rather schizophrenic in nature. Triple-digit temperatures occurred at many locations early that first week, including Hollis, which set an all-time record high for October on the 3rd of the month with a temperature of 106 degrees. Those hot conditions were followed quickly in the latter parts of the week by a widespread first-freeze for much of the state, with some high temperatures dropping more than 50 degrees in three days.

For the second time in three years, the statewide-averaged annual precipitation was above normal despite the presence of an intense warm-season drought. The statewide total of 36.79 inches was 2.55 inches greater than normal, making 2000 the 32nd wettest year on record. The year began rather dry, with March being the only month in the first five to finish with above normal precipitation, becoming the 9th wettest March on record. June, however, roared in and reversed the trend with a statewide average of 7.19 inches, which is 3.24 inches greater than normal, ranking it as the 7th wettest June since 1892. Of the 112 Mesonet stations, 15 had monthly rainfall totals of 10 inches or more. Westville led the pack with 17.06 inches, and Oklahoma City had 6.71 inches of rain over a span of 16 days, breaking the old record of 15 days set the previous year. Many localities in eastern Oklahoma reported flash flooding, with one drowning being reported. Adair officials were forced to declare a state of emergency due to the flooding at one point.

Statewide-Averaged Precipitation (Inches) by Month (Rank: 1=driest, 109=wettest)

<u>Month</u>	<u>Precip.</u>	<u>Dep.</u>	<u>Rank</u>
January	1.13	-0.13	50
February	1.47	-0.26	57
March	4.23	+1.42	100
April	2.55	-0.54	35
May	4.43	-0.43	47
June	7.19	+3.24	102
July	2.59	-0.03	49
August	0.13	-2.69	1
September	1.03	-2.84	8
October	6.48	+3.41	104
November	3.58	+1.16	88
December	1.98	+0.32	79

Less than 2 months later, the state was in the throes of a damaging and costly drought. The inception point of the drought, August, was the driest warm-season month experienced in the 109 years of record keeping. The month's statewide-averaged precipitation total of 0.13 inches was 2.69 inches less than normal, breaking the previous record of 0.22 inches in the dust-bowl year of August 1936. September was also extremely dry, with its statewide-averaged precipitation total of 1.03 inches being 2.84 inches less than normal for the month, ranking it the 8th driest September on record. Combined, the two-month accumulation of 1.16 inches ranks the 2000 August-September as the driest such period on record. During this period, temperatures soared, resulting in two heat-related deaths in the Oklahoma City area. The Governor declared a drought emergency in several counties along the Red River, an area that many felt had not fully recovered from the severe drought in 1998. Extensive damage to summer row crops was reported, and pastures and stock water deteriorated rapidly. The winter wheat crop planting was delayed as available soil moisture dwindled. Wildfire potential increased dramatically, coming to fruition in mid-September with several major wildfire outbreaks. In all, drought-related losses totaled over \$600 million dollars.

The drought was broken with a vengeance in October as the skies opened up with a statewide-averaged total of 6.48 inches of rain, 3.41 inches greater than normal, ranking it as the 5th wettest October on record. As in June, flash flooding occurred in several areas. The winter wheat crop was not helped by the heavy rainfall, however, as the fields became too wet, delaying its planting once again.

Putting punctuation on the state's extreme weather in 2000, December came complete with three devastating winter storms. The worst of these storms struck on Christmas day, and when it ended, it became the worst winter storm the state had experienced since the Christmas-week storm of 1987. Holiday travel ground to a virtual halt as the state was blanketed in ice and snow, snapping power lines and leaving as many as 170,000 residents and businesses without power. The damage from ice accumulation was particularly severe in the heavily forested southeastern quarter of the state. Tragically, 22 deaths occurred between Christmas and New Year's Day, all attributable to the weather.

While winter storms and drought stole the show in 2000, severe weather still reared its ugly head occasionally. The year's total of 44 tornadoes was 10 less than normal, due mainly to a very benign April, May, and June. The dearth of tornadoes in these months was largely offset by the very active months of March and October, as half of the year's tornadoes occurred in these two months. Of the 44 tornadoes, 39 were rated F0 or F1 on the Fujita scale, meaning they were of the less destructive variety. The remaining 5 were rated F2, which classifies them as "significant" tornadoes, containing winds of up to 157 miles per hour.

The most destructive tornado in 2000 was an F2 that struck near Hodgen in LeFlore County on March 26th. The tornado left 11 mobile homes damaged or destroyed in its 4-mile path, along with 2 poultry barns. Damage was estimated at \$1.2 million. Fortunately, no injuries occurred with this storm. An F1 tornado caused 5 injuries and \$250,000 in damage near Hartshorne in Pittsburg County on April 23. On the same day, an F2 tornado injured 2 near Wright City in McCurtain County. This same tornado moved through downtown Broken Bow and struck a Wal Mart, but at that time its intensity was rated as an F0, the weakest of the tornado intensities on the Fujita scale. Only \$40,000 in damage was reported from this storm. In all, there were 7 injuries and \$2.2 million in damage from tornadoes in 2000.

Gary D. McManus

CLIMATE DIVISION MAP

EXPLANATION OF TABLES

The tables appearing on the preceding pages contain the following information for each station or climate division:

Station Name: The name of the observing site.

Station Identification Number: These numbers usually are assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These numbers are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Temperature: The maximum daily maximum temperature observed during the current month and year and the day on which it occurred.

Minimum Daily Temperature: The minimum daily minimum temperature observed during the current month and year and the day on which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. HDD are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. See the equation to the right for the HDD calculation.

Deviation from Normal Heating Degree Days: The difference between the actual HDD and the normal HDD for the month. A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. CDD are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. See the equation to the right for the CDD calculation.

Deviation from Normal Cooling Degree Days: The difference between the actual HDD and the normal HDD for the month. A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as a mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: The difference between the actual rainfall and the normal rainfall for the month. A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from the monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

Heating Degree Days Calculation

NumDays

$$\sum_{i=1}^{NumDays} 65 - ((TMAX_i + TMIN_i) / 2)$$

Where NumDays = the number of days in the month of interest (e.g., NumDays = 31 for January)

Cooling Degree Days Calculation

NumDays

$$\sum_{i=1}^{NumDays} ((TMAX_i + TMIN_i) / 2) - 65$$

Where NumDays = the number of days in the month of interest (e.g., NumDays = 30 for June)

CONTACT INFORMATION

Oklahoma Climatological Survey
The University of Oklahoma
100 East Boyd Street, Suite 1210
Norman, OK 73019-1012
